Title:

Smart Retail Customer Analysis & Prediction

Abstract:

The Smart Retail Customer Analysis & Prediction system is designed to help retail businesses understand customer behaviour and make data-driven decisions. The proposed system analyses customer-related data such as purchasing patterns, transaction history, product preferences, purchase frequency, and spending behaviour to identify meaningful customer segments and trends.

The system applies data analysis and machine learning techniques to classify customers based on their behaviour and predict potential future purchasing patterns. Customer segmentation can help retailers identify groups such as high-value customers, frequent customers, and customers who may require targeted promotional offers. The prediction component can assist in estimating customer purchase behaviour and identifying customers who are likely to make future purchases.

The system provides an easy-to-understand interface through which retailers can view customer insights, analyse purchasing trends, and obtain prediction results. By combining customer analytics with predictive techniques, the proposed system aims to improve customer engagement, personalized marketing, sales planning, and decision-making. Overall, the project demonstrates how data-driven customer analysis and prediction can be applied to develop a smarter and more efficient retail management system.
